React Source Code Examples

Full, runnable component files for every pattern in the React notes & cheat sheet

1. Greeting.jsx

JSX basics: expressions, variables, Fragments

```jsx
// Greeting.jsx
// Demonstrates: JSX expressions, embedding variables, Fragments

function Greeting() {
  const name = "Sam";
  return <h1>Hello, {name}!</h1>;
}

function FragmentExample() {
  return (
    <>
      <Greeting />
      <p>Welcome to React.</p>
    </>
  );
}

export default FragmentExample;

```

2. Welcome.jsx

Components & props: function components, children, default props

```jsx
// Welcome.jsx
// Demonstrates: function components, props, default prop values, children

function Welcome({ name }) {
  return <p>Welcome back, {name}!</p>;
}

function Avatar({ src, alt }) {
  return <img src={src} alt={alt} className="avatar" />;
}

function Card({ children }) {
  return <div className="card">{children}</div>;
}

function Button({ label = "OK", onClick }) {
  return <button onClick={onClick}>{label}</button>;
```

```
}

function App() {
  return (
    <Card>
      <Welcome name="Asha" />
      <Avatar src="/me.png" alt="My profile photo" />
      <Button label="Continue" onClick={() => console.log("clicked")} />
    </Card>
  );
}

export default App;

```

3. Counter.jsx

State & events: useState, onClick, functional updates

```
// Counter.jsx
// Demonstrates: useState, click events, functional state updates

import { useState } from "react";

function Counter() {
  const [count, setCount] = useState(0);

  function increment() {
    setCount((c) => c + 1);
  }

  return (
    <button onClick={increment}>
      Clicked {count} times
    </button>
  );
}

export default Counter;

```

4. Form.jsx

Forms: onSubmit, controlled input, onChange

```
// Form.jsx
// Demonstrates: form submission, controlled inputs, onChange

import { useState } from "react";

```

```jsx
function Form() {
  const [text, setText] = useState("");

  function handleSubmit(e) {
    e.preventDefault();
    console.log("Submitted:", text);
  }

  return (
    <form onSubmit={handleSubmit}>
      <input
        value={text}
        onChange={(e) => setText(e.target.value)}
        placeholder="Type something..."
      />
      <button type="submit">Send</button>
    </form>
  );
}

export default Form;

```

5. FruitList.jsx

Lists: rendering arrays with .map() and the key prop

```jsx
// FruitList.jsx
// Demonstrates: rendering arrays with .map(), the key prop

const fruits = [
  { id: 1, name: "Apple" },
  { id: 2, name: "Banana" },
  { id: 3, name: "Cherry" },
];

function FruitList() {
  return (
    <ul>
      {fruits.map((fruit) => (
        <li key={fruit.id}>{fruit.name}</li>
      ))}
    </ul>
  );
}

export default FruitList;

```

6. Status.jsx

Conditional rendering: ternary, logical AND, early return

```jsx
// Status.jsx
// Demonstrates: ternary rendering, logical AND, early return (render nothing)

function Status({ isLoggedIn, hasError, visible }) {
  if (!visible) return null;

  return (
    <div>
      {isLoggedIn ? <p>Welcome back!</p> : <p>Please log in.</p>}
      {hasError && <p className="error">Something went wrong.</p>}
    </div>
  );
}

export default Status;

```

7. Clock.jsx

Side effects: useEffect, dependency array, cleanup function

```jsx
// Clock.jsx
// Demonstrates: useEffect, dependency array, cleanup function

import { useState, useEffect } from "react";

function Clock() {
  const [time, setTime] = useState(new Date());

  useEffect(() => {
    const id = setInterval(() => setTime(new Date()), 1000);
    return () => clearInterval(id); // cleanup on unmount
  }, []); // empty array = run once on mount

  return <p>{time.toLocaleTimeString()}</p>;
}

export default Clock;

```
